Astor Hotel Suite 622  
924 East Juneau Ave.  
Milwaukee, Wisconsin 53202

Dear Dr. Bader:

It was a pleasure to meet you and to have the opportunity to show you through the Gallery. I hope you enjoyed your tour, and I look forward to working with you in the future.

I have enclosed a color photograph of the Neefs oil on copper you admired. Relevant information is on the reverse. The price shown is retail and our discount to the trade is 20% on paintings.

I regret that I am unable to supply black and white photographs of the Neefs or the unsigned Dutch oil on canvas at this time. I will forward to you as soon as possible.

Thank you for your interest and the time you allowed me. If you have any questions, or if I may be of any further service, Please do not hesitate to contact me.

Yours truly,

*Marty Yukon*

ESTABLISHED 1961

March 28, 1995

Mr. Marty Yukon  
Manheim Galleries New Orleans  
403-409 Royal Street  
New Orleans, LA 70130

Dear Mr. Yukon:

Thank you for your kind reception of Isabel and me two weeks ago.

Thank you also for sending me the photograph of the painting called Neefs, which I return. There is no question in my mind that this is not by the well-known painter of church interiors of the 17th Century. Either the signature is a fake, or there was another painter by the same name in the 18th Century.

As you know I liked the pleasant, unattributed landscape of the 18th Century and hope that sometime you will be able to send me a good photograph. Even if we cannot get together on price, I might be able to send you an attribution.

Again, with many thanks, I remain,

Yours sincerely,

AB/cw

RECEIVED  
JAN 15 1964  
FROM  
DR. J. H. GOLDSTEIN  
TO  
DR. R. M. MAYER  
SUBJECT  
POLYMERIZATION OF STYRENE  
IN AQUEOUS SOLUTION  
AT 50°C

Enclosed are two copies of a report on the polymerization of styrene in aqueous solution at 50°C. The report describes the experimental conditions and the results obtained. The polymerization was carried out in a stirred reactor at a constant temperature of 50°C. The monomer concentration was 0.1 mole/liter and the initiator concentration was 0.001 mole/liter. The reaction was allowed to proceed for 24 hours before being terminated. The polymer obtained was dried and weighed. The results show that the polymerization rate is proportional to the square root of the initiator concentration. This is consistent with the theory of free-radical polymerization. The molecular weight of the polymer was determined by gel permeation chromatography. The results show that the molecular weight is independent of the initiator concentration. This is also consistent with the theory of free-radical polymerization.

Very truly yours,  
J. H. Goldstein
